

Issue Log

Critical Issues

Need to pull HTML form data (amount, name, category) to use in PHP SQL query. This is necessary to accurately update database.

Throw a warning when a duplicate upc is being added. Maybe don't give the option of choosing if it already exists in database or not. Doing so would make it impossible to get duplicates. Possibly even prevent this from database side.

Category of newly added items is not posting properly to database.

Shown data is sometimes popping up as last entered item until refreshed.

Non-Critical Issues

Current inventory data (name, category) not showing on add inventory page when switching from No to Yes.

PHP error message briefly showing when adding (on add inventory page). Fix by deleting print_r of error message once work on page is done.

Make desired form fields required (e.g. reason for removal).

Need to be able to tie name to certain checked-out items within the database (eg if category is computer). Need to tie in reason for removal to a removal log.

Put web page header, title, etc. in a separate template file so if one thing needs to change, it will not have to be changed in all html files.

Should use <meta name="viewport" content="width=device-width, initial-scale=1.0"> tag as a standard on all html pages.

Create View Inventory page to see current quantities without having to go to an altering option.

If attempting to check in/out a upc that is not in inventory, throw an error.

Non-Issues

Documentation – comments, tutorials, graphics of flow between files, etc.

Linting – AirBnB or Google

CSS – clean up spacing, design, etc. (i.e. make it more consistent and standardized)
