

# Issue Log

## Critical Issues

Need to pull HTML form data (amount, name, category) to use in PHP SQL query. This is necessary to accurately update database.

Throw a warning when a duplicate upc is being added. Maybe don't give the option of choosing if it already exists in database or not. Doing so would make it impossible to get duplicates. Possibly even prevent this from database side.

Category of newly added items is not posting properly to database.

Shown data is sometimes popping up as last entered item until refreshed.

## Non-Critical Issues

Current inventory data (name, category) not showing on add inventory page when switching from No to Yes.

PHP error message briefly showing when adding (on add inventory page). Fix by deleting print\_r of error message once work on page is done.

Need to ensure same sizing of scanner on index.html across all devices

"Item not found" and Cancel button showing on action page when item not in inventory. Potentially route directly to add inventory page in this case

Default not blank when adding new item to inventory.
