

## Tasks

~~Make desired form fields required (e.g. reason for removal).~~

~~Put web page header, title, etc. in a separate template file so if one thing needs to change, it will not have to be changed in all html files.~~

~~If attempting to check in/out a upe that is not in inventory, throw an alert.~~

Tie name to certain checked-out items within the database (eg if category is computer).

Document reason for removal to a removal log.

Documentation – comments, tutorials, graphics of flow between files, etc.

Linting – AirBnB or Google

CSS – clean up spacing, design, etc. (i.e. make it more consistent and standardized)

Create View Inventory page to see current quantities without having to go to an altering option.

Or refactor to display item data on the action page and potentially make tying names and reasons for removal easier.
