## **Tasks**

Make desired form fields required (e.g. reason for removal).

Put web page header, title, etc. in a separate template file so if one thing needs to change, it will not have to be changed in all html files.

If attempting to check in/out a upc that is not in inventory, throw an alert.

Refactor to display item data on the action page and potentially make tying names and reasons for removal easier.

Tie name to certain checked-out items within the database (eg if category is computer).

Document reason for removal to a log. Log when an item is added to inventory in the same log.

Write a query to show item tracker with item name and employee name.

Documentation – comments, tutorials, graphics of flow between files, etc.

Linting – AirBnB or Google

CSS – clean up spacing, design, etc. (i.e. make it more consistent and standardized)
