Issue Log

Critical Issues	Non-Critical Issues

~~Need to pull HTML form data (amount, name, category) to use in PHP SQL query. This is necessary to accurately update database.~~

~~Current inventory data (name, category) not showing on add-inventory page when switching from No to Yes.~~

~~Throw a warning when a duplicate upc is being added. Maybe don't give the option of choosing if it already exists in database or not. Doing so would make it impossible to get duplicates. Possibly even prevent this from database side.~~

~~PHP error message briefly showing when adding (on add-inventory page). Fix by deleting print_r of error message once work on page is done.~~

~~Category of newly added items is not posting properly to database.~~

~~Need to ensure same sizing of scanner on index.html across all devices~~

~~Shown data is sometimes popping up as last entered item until refreshed.~~

~~"Item not found" and Cancel button showing on action page when item not in inventory. Potentially route directly to add inventory page in this case~~

Default not blank when adding new item to inventory.

Date not giving accurate seconds in item tracker
