# Issue Log

| Critical Issues | Non-Critical Issues |
|---|---|
| ~~Need to pull HTML form data (amount, name, category) to use in PHP SQL query. This is necessary to accurately update database.~~ | ~~Current inventory data (name, category) not showing on add-inventory page when switching from No to Yes.~~ |
| ~~Throw a warning when a duplicate upc is being added. Maybe don't give the option of choosing if it already exists in database or not. Doing so would make it impossible to get duplicates. Possibly even prevent this from database side.~~ | ~~PHP error message briefly showing when adding (on add-inventory page). Fix by deleting print_r of error message once work on page is done.~~ |
| ~~Category of newly added items is not posting properly to database.~~ | Need to be able to tie name to certain checked-out items within the database. |
| | Make desired form fields required (e.g. reason for removal). |
| | Put web page header, title, etc. in a separate template file so if one thing needs to change, it will not have to be changed in all html files. |
| | Should use <meta name="viewport" content="width=device-width, initial-scale=1.0"> tag as a standard on all html pages. |

**Non-Issues**

Documentation – comments, tutorials, etc.

Linting – AirBnB or Google

CSS – clean up spacing, design, etc. (i.e. make it more consistent and standardized)

Create graphic of flow between files
